## **DETAILED ACTION**

### ***Allowable Subject Matter***

Claims 1-22 are allowed.

The closest prior art to the instant invention is Kress (USP 6,692,198). KRESS teaches a rotationally driven cutting tool for machining of workpieces, having a cutting insert (11) fastened detachably in the tools pocket and clamped flatly against a base surface of the pocket, a fine adjustment device having an adjustment element (27) that is supported on the lateral wall face (23) of the insert (11) and is displaceable relative to the insert via an adjusting screw arrangement ('198, figures 1, 2, 5a-5e and Col. 2, lines 28-37). KRESS also teaches adjusting screw (31) having left-hand external threaded portion (43 and right-hand external threaded portion (45) held through opening of the tool body ('198, figure 5a and col. 3, lines 42-50). Furthermore, KRESS teaches in figure 1, the adjusting screw (31) being placed into the through opening of the tool from the side facing the base surface. KRESS also teaches the set screw (31) is accessible from the right (i.e. can be actuated from the other side opposite the base) ('198, col. 2, lines 44-47).

However, KRESS fails to anticipate or make obvious the adjustment screw having a threaded sleeve as well as the through opening in which the threaded sleeve is held in having a constriction.
